AMENDMENT AND RESPONSE TO OFFICE ACTION AND PETITION FOR EXTENSION OF TIME U.S. 09/904,154 Filed: July 12, 2001

Amendments in the Claims	
Kindly amend the claims as follows:	
1.	Cancelled.
2.	Cancelled.
3.	Cancelled.
4.	Cancelled.
5.	Cancelled.
6.	Cancelled.
7.	Cancelled.
8.	(Currently Amended)The method of claim 6 9, wherein, after the at least one blood
vessel	has been opened, at least one leg of the slaughter animal engages a carrier, whereby
the slaughter animal is at least partially supported by the carrier.	

U.S. 09/904,154 Filed: July 12, 2001

9. (Currently Amended) A method for mechanically opening at least one blood vessel

in the neck of a slaughter animal, wherein the neck comprises a trachea and an esophagus, in

particular a fowl, comprising:

positioning the neck of the slaughter animal, wherein the neck comprises a

longitudinal axis; and

opening the at least one blood vessel by moving at least one cutting device along a

cutting path substantially transverse to the longitudinal axis of the neck and into the neck

from one side of the neck towards an opposite side of the neck, the at least one blood vessel

to be opened being located in the path of the cutting device,

wherein before the at least one blood vessel is opened, the distance between the

trachea and the at least one blood vessel is increased and wherein the body of the slaughter

animal is repositioned from a position below the neck to a position above the neck either

before or after opening of the at least one blood vessel in the neck.

10. (Currently Amended) The method of claim 9 64, wherein, before the at least one blood

vessel is opened, the distance between the esophagus and the at least one blood vessel is also

increased in the area of the opening.

11. (Currently Amended) The method of claim 9 64, wherein said distance is increased by

moving at least two separating members, each having an end, into the neck of the slaughter

animal until the ends of the two separating members are proximal to each other at a location

3

ATLLIB01 1854502.1

U.S. 09/904,154

Filed: July 12, 2001

between the trachea and the at least one blood vessel, in particular at a location between the

esophagus and the at least one blood vessel, and then moving the separating members and a

part of the neck apart substantially transversely with respect to the longitudinal direction of

the neck.

12. (Original) The method of claim 11, wherein the neck is fixed in place and the

separating members move with respect to a part of the neck.

13. (Original) The method of claim 12, wherein the separating members, after they

have been moved into the neck, move towards the front side or the rear side of the neck.

14. Cancelled.

15. Cancelled.

16. Cancelled.

17. (Currently Amended) The device of claim 16 66, wherein the cutting device comprises

a substantially elongate blade having a sharp, inclined front side and a longitudinal axis,

wherein the blade is adapted to move along the cutting path substantially in a direction

parallel to the longitudinal axis of the blade.

U.S. 09/904,154

Filed: July 12, 2001

18. (Original) The device of claim 17, wherein the blade is adapted to be moved to

and fro substantially along a line.

19. (Currently Amended) The device of claim 16 66, wherein the neck positioning

device engages the neck in the area which extends from the underside of the head of the

slaughter animal to the second cervical vertebra.

20. (Original) The device of claim 19, further comprising a head carrier for carrying

the slaughter animal by its head.

21. (Original) The device of claim 20, wherein the head carrier comprises a

substantially U-shaped carrying opening, the transverse dimension of which is smaller than

the width of the head of the slaughter animal.

22. (Original) The device of claim 20, wherein the head carrier forms part of a

conveyor having a conveyor path, wherein the conveyor path at least extends from a location

where slaughter animals are supplied to the location of the blood vessel opening device.

23. Cancelled.

U.S. 09/904,154

Filed: July 12, 2001

24. (Currently Amended) The device of claim 23 66, wherein the separating device is

adapted to increase the distance between the esophagus and the at least one blood vessel.

25. (Currently Amended) The device of claim 23 66, wherein the separating device

comprises two separating members, each having an end and adapted to be positioned

adjacent the neck of the slaughter animal, wherein the separating members move from an

open position into the neck into a closed position, whereby the ends of the separating

members are moved proximal to each other at a location between the trachea or the

esophagus and the at least one blood vessel.

26. (Original) The device of claim 25, wherein the end of at least one of the

separating members is blunt.

27. (Original) The device of claim 25, wherein the separating members are adapted, in

their closed position, to be moved towards the front side or the rear side of the neck.

28. (Currently Amended) The device of claim 16 66, further comprising a leg positioning

device for positioning at least one leg of the slaughter animal in a leg support which interacts

with the leg positioning device.

U.S. 09/904,154

Filed: July 12, 2001

29. (Original) The device of claim 28, wherein the leg positioning device comprises a

support which can tilt about an axis, for tilting at least part of the at least one leg from a

substantially vertical position into a substantially horizontal position.

30. (Original) The device of claim 29, wherein said part of the leg extends below the

knee joint.

31. (Original) The device of claim 29, wherein the support is adapted to support the

breast of the slaughter animal.

32. (Original) The device of claim 29, wherein the support is provided with a gripper

device for securely gripping the at least one leg.

33. (Original) The device of claim 28, further comprising one or more stops, which

interact with the leg positioning device, for positioning the at least one leg substantially in a

horizontal plane.

34. (Currently Amended) The device of claim 16 66, wherein the neck positioning device

comprises a head support for supporting the head and a shoulder support for supporting the

shoulders of the slaughter animal.

U.S. 09/904,154

Filed: July 12, 2001

35. (Withdrawn) A device for imposing a distance between stunned or dead slaughter

animals or parts thereof, the device comprising:

a first conveyor for conveying the slaughter animals or parts thereof along a first

conveyor path in a first direction, and

a second conveyor leading from the first conveyor for conveying the slaughter

animals or parts thereof along a second conveyor path in a second direction, wherein the first

direction differs from the second direction.

36. (Withdrawn) The device of claim 35, wherein the angle between the first direction

and the second direction is at least 45°.

37. (Withdrawn) The device of claim 35, wherein the second conveyor comprises a

conveyor belt having walls positioned at substantially regular intervals along the conveyor

belt, wherein the plane of each wall is oriented at an angle of at least 45° with respect to the

plane of the conveyor belt.

38. (Withdrawn) A device for imposing a distance between stunned or dead slaughter

animals or parts thereof, the device comprising:

a first conveyor having a discharge end for conveying the slaughter animals or parts

along a first conveyor path in a first direction, and

U.S. 09/904,154

Filed: July 12, 2001

a second conveyor, at least part of which extends beneath the discharge end of the

first conveyor, for conveying the slaughter animals or parts thereof, wherein the second

conveyor comprises a conveyor belt having walls positioned at substantially regular intervals

along the conveyor belt, wherein the plane of each wall is oriented at an angle of at least 45°

with respect to the plane of the conveyor belt.

39. (Withdrawn) The device of claim 35, further comprising a set of guides positioned

substantially stationary above the first conveyor to delimit a passage that becomes narrower

in the conveying direction, wherein the passage has a minimum width which substantially

corresponds to or is slightly greater than the smallest width dimension of the slaughter

animal or the part thereof.

40. (Withdrawn) The device of claim 39, wherein one of the guides comprises a

conveyor belt adapted to be driven in a direction substantially opposite to the first direction.

41. (Withdrawn) A device for orienting a stunned or dead slaughter animal, or a part

thereof, the device comprising:

a conveyor for conveying the slaughter animal or part thereof along a conveyor path

and in a conveying direction; and

U.S. 09/904,154

Filed: July 12, 2001

an orientation device for transferring the slaughter animal or the part thereof from a

first location in a first orientation to a second location and into a second orientation on the

conveyor.

42. (Withdrawn) The device of claim 41, wherein the orientation device comprises a set

of guides arranged substantially stationary above the conveyor to delimit a passage that

becomes narrower in the conveying direction, wherein the passage has a minimum width

which substantially corresponds to the smallest width dimension of the slaughter animal or

part thereof.

43. (Withdrawn) The device of claim 41, wherein the orientation device comprises a

liquid bath having a set of guides arranged in the vicinity of the water surface to delimit a

passage that becomes narrower in the conveying direction, wherein the passage has a

minimum width which substantially corresponds to the smallest width dimension of the

slaughter animal or part thereof.

44. (Withdrawn) The device of claim 41, wherein the orientation device comprises at

least one manipulator to engage the slaughter animal or the part thereof, wherein the device

further comprises:

U.S. 09/904,154

Filed: July 12, 2001

an image processing system, arranged above the conveyor and upstream of at least

one manipulator, for supplying image information relating to the slaughter animal or the part

thereof located on the conveyor;

a data processing system coupled to the image processing system and the at least one

manipulator,

the data processing system being adapted to determine, on the basis of the image

information, the first location and the first orientation of the slaughter animal or the part

thereof and to control the manipulator to orient the slaughter animal or part thereof at the

second location and in the second orientation.

45. (Withdrawn) The device of claim 44, wherein the manipulator comprises a drum

arranged above the conveyor, wherein the drum has an axis of rotation and fingers projecting

from the drum substantially radially with respect to the axis.

46. (Withdrawn) The device of claim 44, wherein the manipulator comprises a blowing

nozzle arranged above the conveyor, wherein the nozzle comprises blowing openings and

can pivot about an axis.

47. (Withdrawn) The device of claim 44, wherein the manipulator comprises at least one

arm having a gripper device positioned at one end of the arm for securely gripping the

slaughter animal or part thereof.

11

ATLLIB01 1854502.1

U.S. 09/904,154

Filed: July 12, 2001

48. (Withdrawn) The device of claim 44, wherein the manipulator comprises a suction

nozzle for sucking the slaughter animal or the part thereof.

49. (Withdrawn) The device of claim 41, wherein the orientation means comprises an

elongate cylinder which can rotate about its longitudinal axis.

50. (Withdrawn) The device of claim 49, wherein the cylinder comprises a helical raised

wall along an inner surface of the cylinder.

51. (Withdrawn) A device for hanging a slaughter animal from a hook, comprising:

a first conveyor, parallel to which a guide is arranged at a distance on either side; and

a second conveyor for advancing the hooks beneath and parallel to the first conveyor

for hooking onto legs of the slaughter animal which is situated on the first conveyor.

52. (Withdrawn) A device for hanging a slaughter animal from a hook, comprising:

a conveyor with a conveying direction for conveying the slaughter animal with the

legs oriented in the conveying direction;

a stop arranged above the conveyor for stopping conveyance of the slaughter animal;

and

U.S. 09/904,154

Filed: July 12, 2001

a gripper device for securely gripping the slaughter animal and hanging it from a

hook.

53. (Withdrawn) A device for hanging a slaughter animal from a hook, comprising:

a belt conveyor for conveying the slaughter animal; and

a hook conveyor for advancing at least one hook upwardly towards an edge of the belt

conveyor.

54. (Withdrawn) A device for hanging a slaughter animal from a hook, comprising:

two substantially parallel and synchronously driven belt conveyors arranged adjacent

but at a distance from one another to form a gap between the belt conveyors, wherein the

neck of the slaughter animal is positioned in the gap between the belt conveyors; and

a hook conveyor for advancing hooks along the underside of the belt conveyors and at

least partially parallel thereto at the level of the gap for receiving the neck for hanging the

slaughter animal by its head.

55. (Withdrawn) A device for hanging slaughter animals or parts thereof from hooks,

comprising:

a moving conveyor surface for conveying the slaughter animals or parts thereof;

an overhead conveyor for conveying hooks and arranged partially above the conveyor

surface,

wherein an upstream part of the overhead conveyor is arranged above a downstream

part of the conveyor surface and a downstream part of the overhead conveyor is arranged

above an upstream part of the conveyor surface.

56. (Withdrawn) A device for hanging slaughter animals or parts thereof from hooks,

comprising:

a moving conveyor surface for conveying the slaughter animals or parts thereof;

an overhead conveyor for conveying hooks and arranged above the conveyor surface,

wherein a wall is positioned above the conveyor surface for blocking the slaughter

animals or parts thereof conveyed on the conveyor surface.

57. (Withdrawn) The device of claim 55, wherein the conveyor surface is formed by an

annular disc.

58. (Withdrawn) The device of claim 56, wherein the wall is displaceable.

59. (Withdrawn) A device for hanging slaughter animals or parts thereof from hooks,

comprising:

a conveyor surface for conveying the slaughter animals or parts thereof, wherein the

conveyor surface has a first side and a second side;

a number of ejectors arranged along the first side of the conveyor surface for ejecting

the slaughter animals or parts thereof from the conveyor surface;

a number of holders arranged along the second side of the conveyor surface, opposite

the ejectors, for collecting slaughter animals or parts thereof which have been ejected from

the conveyor surface; and

an overhead conveyor for conveying the hooks and arranged partially above the

holders.

60. (Withdrawn) A device for hanging slaughter animals or parts thereof from hooks,

comprising:

a number of holders for the slaughter animals or parts thereof;

an overhead conveyor arranged partially above the holders; and

a conveyor surface for conveying the slaughter animals or parts thereof, wherein the

conveyor surface has a discharge end which can be displaced for discharging the slaughter

animals to a predetermined holder.

61. (Withdrawn) The method of claim 7, wherein, after the at least one blood vessel has

been opened, at least one leg of the slaughter animal engages a carrier, whereby the slaughter

animal is at least partially supported by the carrier.

U.S. 09/904,154

Filed: July 12, 2001

62. (Withdrawn) The device of claim 38, further comprising a set of guides positioned

substantially stationary above the first conveyor to delimit a passage that becomes narrower

in the conveying direction, wherein the passage has a minimum width which substantially

corresponds to or is slightly greater than the smallest width dimension of the slaughter

animal or the part thereof.

63. Cancelled.

64. (Currently Amended) A method for mechanically opening at least one blood vessel in

the neck of a slaughter animal, wherein the neck comprises a trachea and an esophagus, in

particular a fowl, comprising:

positioning the neck of the slaughter animal; and

opening the at least one blood vessel by moving at least one cutting device along a

path and into the neck from one side of the neck towards an opposite side of the neck, the at

least one blood vessel to be opened being located in the path of the cutting device,

wherein the neck comprises a trachea and wherein the distance between the trachea

and the at least one blood vessel is increased before the at least one blood vessel is opened.

65. Cancelled.

U.S. 09/904,154

Filed: July 12, 2001

66. (Currently Amended) A device for cutting into at least one blood vessel in the

neck of a slaughter animal, in particular a fowl, comprising:

a neck positioning device for positioning the neck of the slaughter animal, wherein

the neck comprises a trachea and an esophagus;

a separating device for increasing adapted to increase the distance between the trachea

of the slaughter animal and the at least one blood vessel; and

a blood vessel opening device for opening the at least one blood vessel and creating

an opening, wherein the blood vessel opening device comprises at least one cutting device

adapted to move along a cutting path through the neck from one side of the neck to another

side of the neck, wherein the at least one blood vessel to be opened is located along the

cutting path of the cutting device.

67. Cancelled.

68. Cancelled.

69. (Currently Amended) The method of claim 9 64, wherein the cutting device

comprises a substantially elongate blade having a sharp, inclined front side and a longitudinal

axis, wherein the blade is moved along the path substantially in a direction parallel to its

longitudinal axis, the at least one blood vessel which is to be opened being located in the path

of the inclined side of the blade.

U.S. 09/904,154

Filed: July 12, 2001

70. (Previously Presented) The method of claim 69, wherein the blade is moved to

and fro substantially along a line.

71. (Currently Amended) The method of claim 9 64, wherein the at least one blood

vessel opened comprises at least one jugular vein.

72. (Currently Amended) The method of claim 9 64, wherein the slaughter animal

is killed before the at least one blood vessel is opened.

73. (Previously Presented) The method of claim 72, wherein the slaughter animal is

killed in a gas atmosphere.

74. (Currently Amended) The method of claim 9 64, wherein the at least one blood

vessel opened comprises at least one carotid artery.

75. (New) The device of claim 66, further comprising a body repositioning device for

repositioning the body of the slaughter animal from a position below the neck to a position

above the neck, wherein the blood vessel opening device is adapted to open the at least one

blood vessel before or after the body of the slaughter animal has been repositioned above the

neck.
